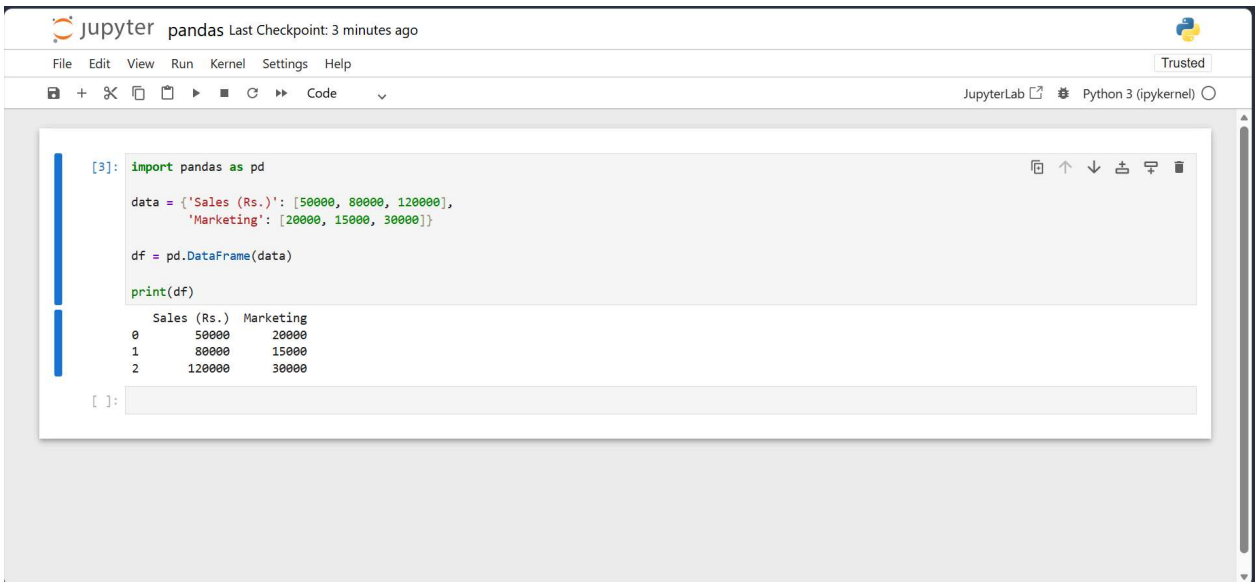
PANDAS

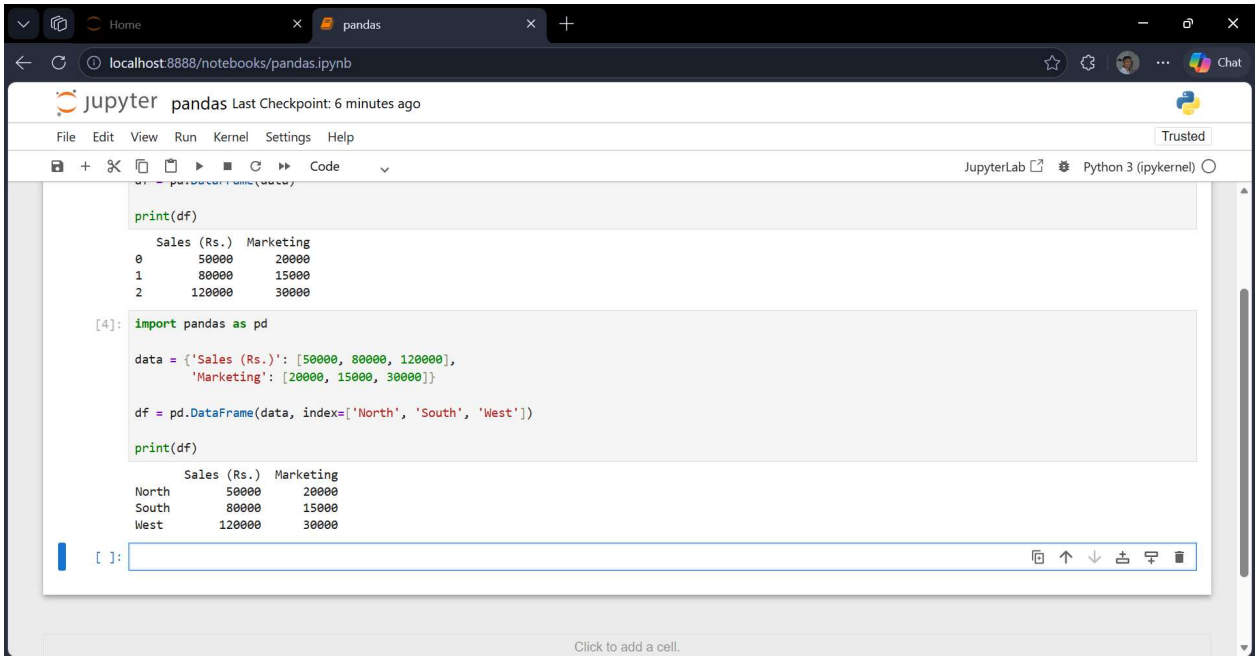
Pandas is a software library written for the Python programming language for data manipulation and analysis. In particular, it offers data structures and operations for manipulating numerical tables and time series.

To install pandas,use the command:-

Pip install pandas



In pandas by default ,the indexing will start from 0,1 and so on .If we want we can also create our own indexing.

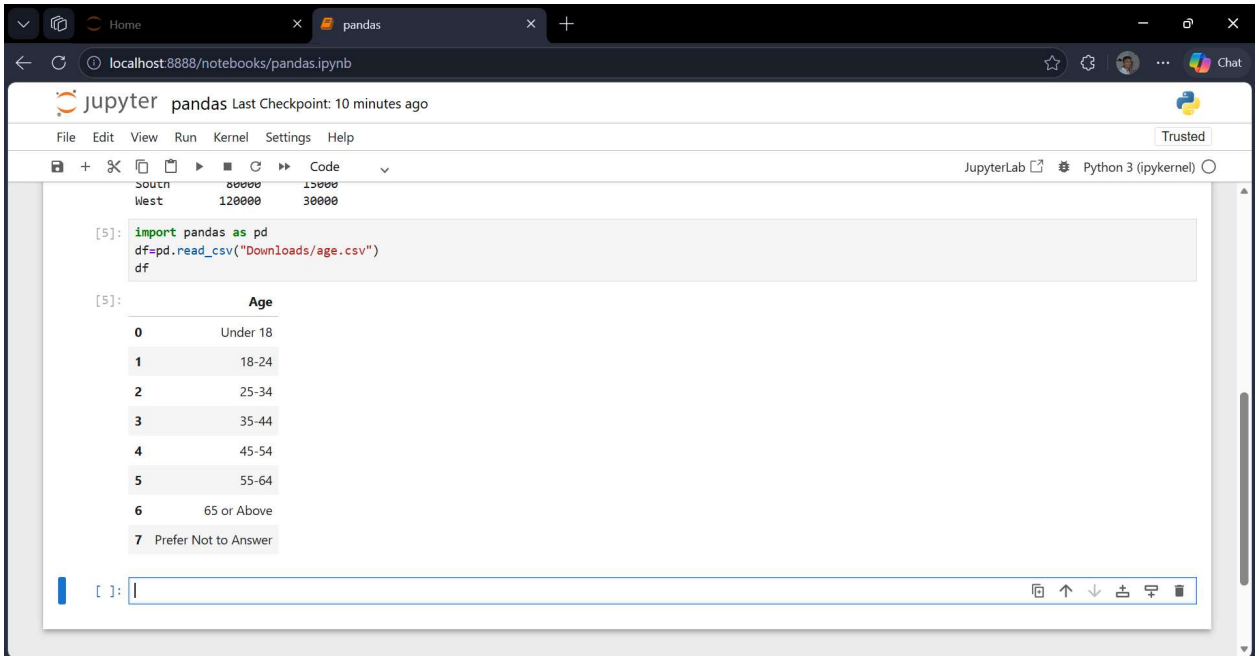


Pull data from Comma Separated File (CSV)

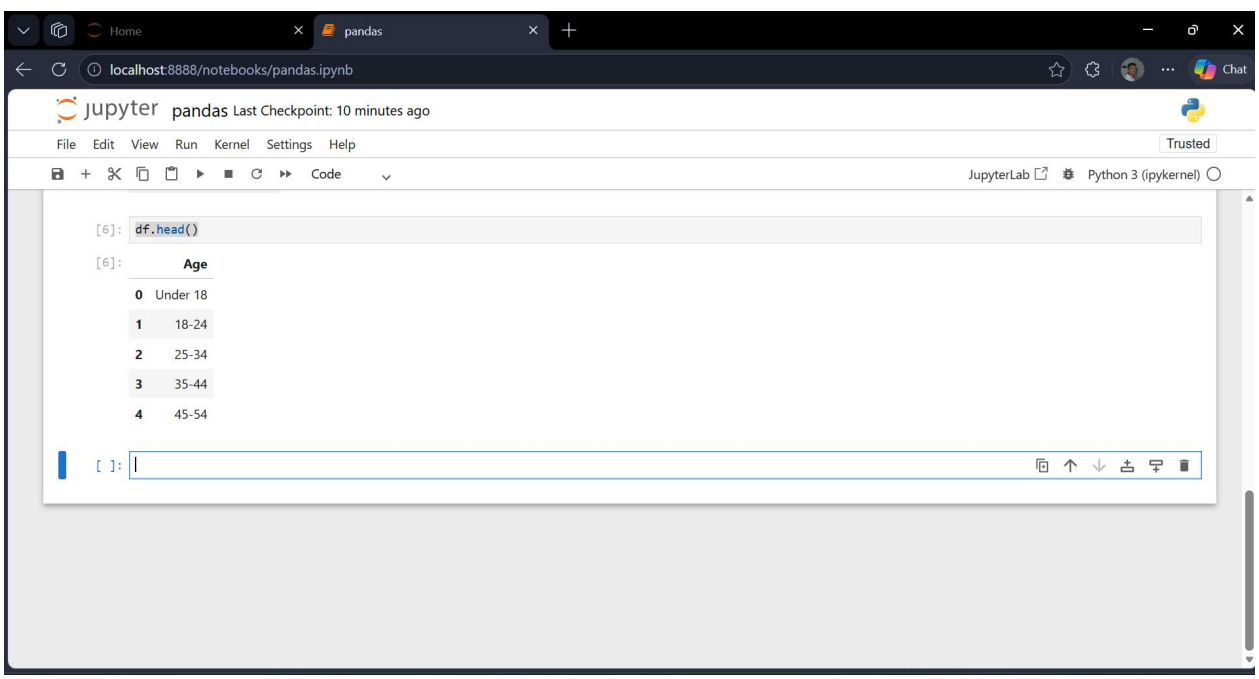
- https://wsform.com/knowledgebase/sample-csv-files/
- Search **age.csv** under Personal Category
- Click the file to download it
- Verify that it is a .csv file by looking at properties
- Open the file in excel to view the sample data

comma separated file CSV is normal data stored in excel separated by commas

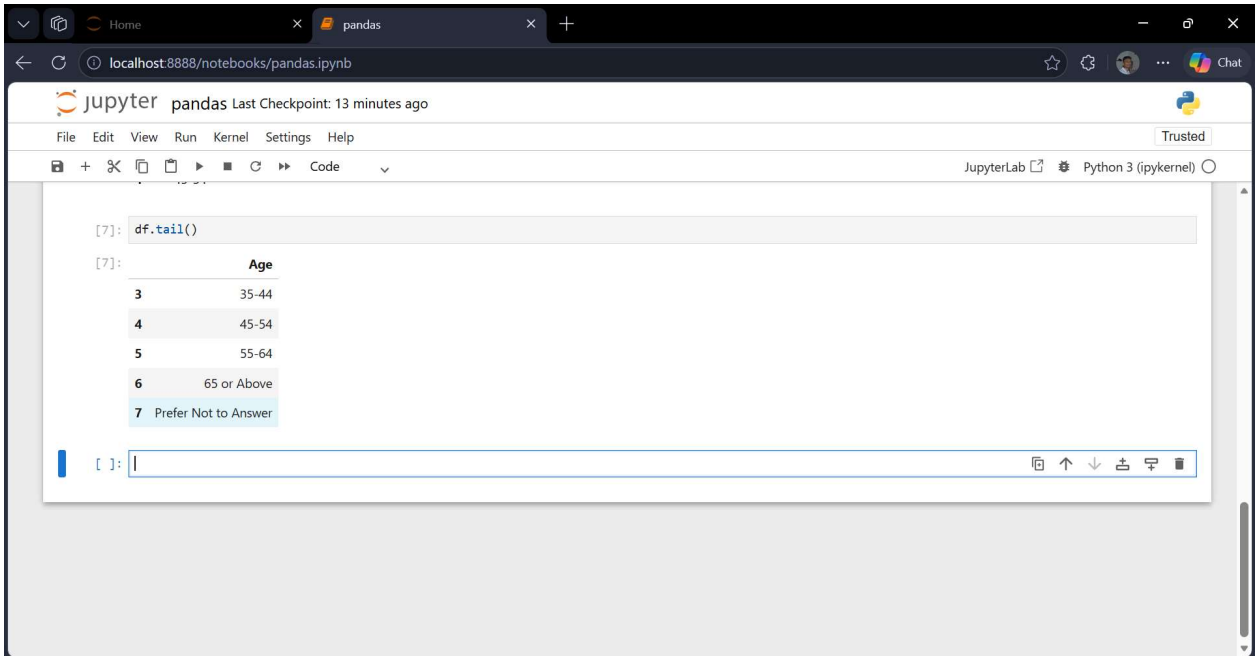
Example:- breakfast,lunch,dinner



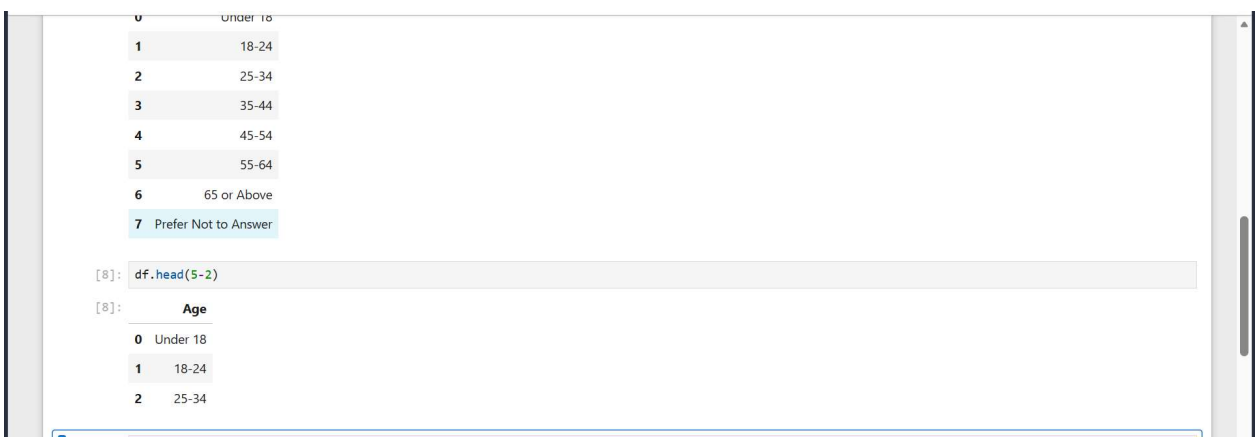
head() function is used to get the top 5 values.

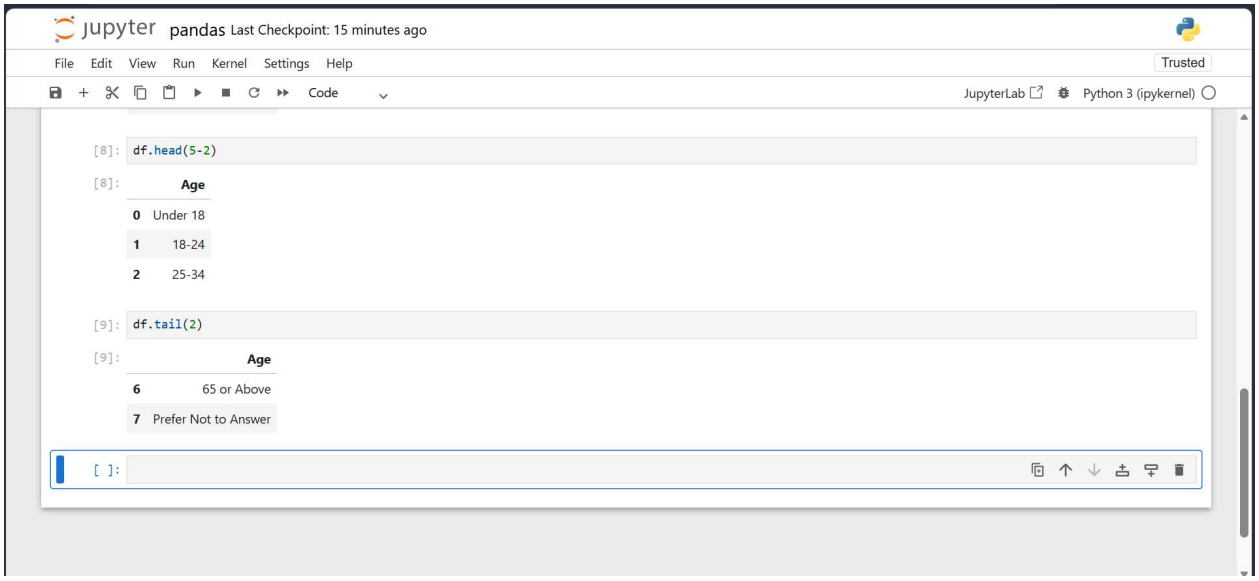


tail() function can we used to get the last 5 values.



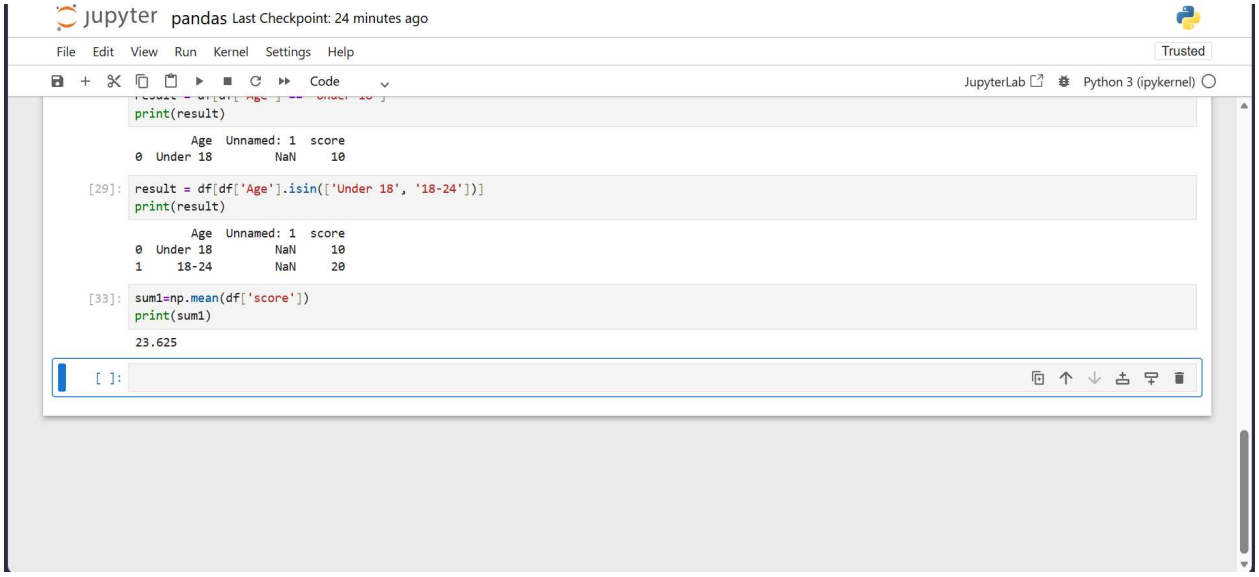
You can also add parameters like 10 or 10-7 for the head and tail functions





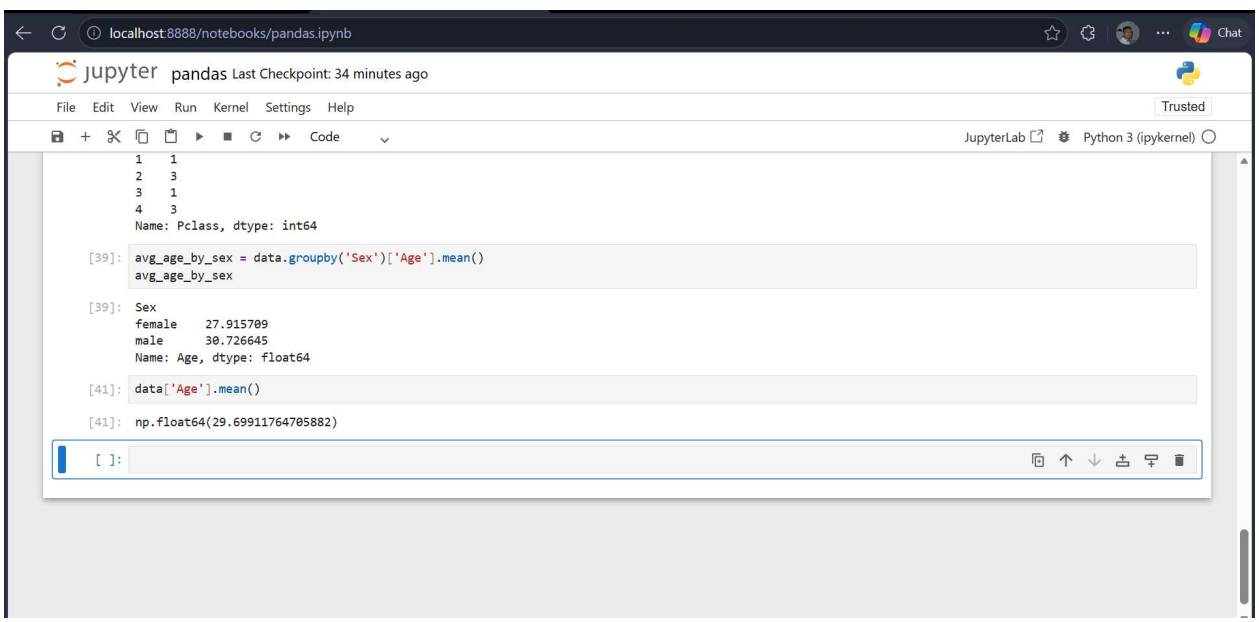
You can also add conditions:-

You can find the average value using mean() function.



Using pandas: Titanic data scenario

• Using the data about the passengers onboard on the Titanic we can use pandas to find out some meaningful insight on data

• Ex**. What is the average age for male versus female Titanic passengers?**


We can also select the column that we need **.**
