

1. Basic Data Editing (Cut, Copy, and Paste)

Excel allows you to move or duplicate the contents of a single cell or a range of cells.

- **Copy:** Duplicates the content to a new location while keeping it in the original spot. **Shortcut: Ctrl + C.**
 - **Cut:** Removes the content from its current location to move it elsewhere. **Shortcut: Ctrl + X.**
 - **Paste:** Places the cut or copied content into a selected target cell. **Shortcut: Ctrl + V.**
-

2. Fill Series

The Fill Series option is used to quickly copy data from one cell to adjacent cells, often creating a sequence.

- **Varying Content:** It can automatically recognize and extend patterns such as:
 - **Numbers** (e.g., 1, 2, 3...).
 - **Days of the week** (e.g., Monday, Tuesday...).
 - **Months** (e.g., January, February...).
 - **Dates.**
-

3. Find and Replace

Located in the **Home tab**, this tool allows you to search for specific words or phrases across an active spreadsheet.

- **Search Options:** You can refine your search by sheet, rows, or specific content types like formulas.
 - **Match Case:** Provides the option to match the exact capitalization of the text.
-

4. Calculations and Formulas

Excel acts as a powerful calculator for numerical, text, or date-type information using cell addresses.

- **The Golden Rule:** Every cell containing a formula **must** begin with an equals sign (=).
 - **Example:** To add two numbers, you would enter `=10+20` into the cell.
-

5. Navigation and Workbook Structure

Modern Excel workbooks are built with a specific grid capacity and navigation shortcuts:

- **Capacity:** A standard sheet contains **16,384 Columns** and **1,048,576 Rows**.
- **Navigation Shortcuts:**
 - **Ctrl + Down Arrow:** Jumps to the last row.
 - **Ctrl + Up/Left Arrow:** Jumps to the top or far-left of the data range.
- **File Extensions:** Excel files are typically saved with the extension **.xls** or **.xlsx**.
