

Managing Active Worksheets

- **Active Sheet Concept:** At any given time, only one workbook is considered the "active workbook," and within it, only one sheet is the "active sheet."
- **Navigation:** To make a specific sheet active, you simply click on its corresponding sheet tab at the bottom of the Excel window.
- **Keyboard Shortcuts:** You can quickly navigate between sheets using your keyboard:
 - **Ctrl + PgUp:** Moves to the previous sheet.
 - **Ctrl + PgDn:** Moves to the next sheet

Organizing and Modifying Sheets

Excel provides several tools to organize your data effectively through the **Format** menu under the "Organize Sheets" section:

- **Rename a Worksheet:** You can change the name of a worksheet to better describe its content. This can be done via the Format menu or by right-clicking the sheet tab.
- **Tab Color:** You can assign custom colors to worksheet tabs to visually categorize or prioritize different sections of your workbook.
- **Add/Insert a New Worksheet:** New blank sheets can be added to the workbook using the "Insert Sheet" option in the cells menu.
- **Move or Copy a Worksheet:**
 - **Move:** Changes the order of the sheets within the current workbook or moves a sheet to a different workbook entirely.
 - **Copy:** Creates an exact duplicate of a worksheet, which is useful for creating templates or backups of data.
- **Delete a Worksheet:** Permanently removes a worksheet and all its data from the workbook through the "Delete Sheet" option.

Format menu contains a **Protection** section, allowing you to "Protect Sheet" or "Lock Cell" to prevent unauthorized editing of your data.
