Title: Creating and Using JavaScript Objects

Description: Students create simple JavaScript objects using object literals and explore properties using key–value pairs.

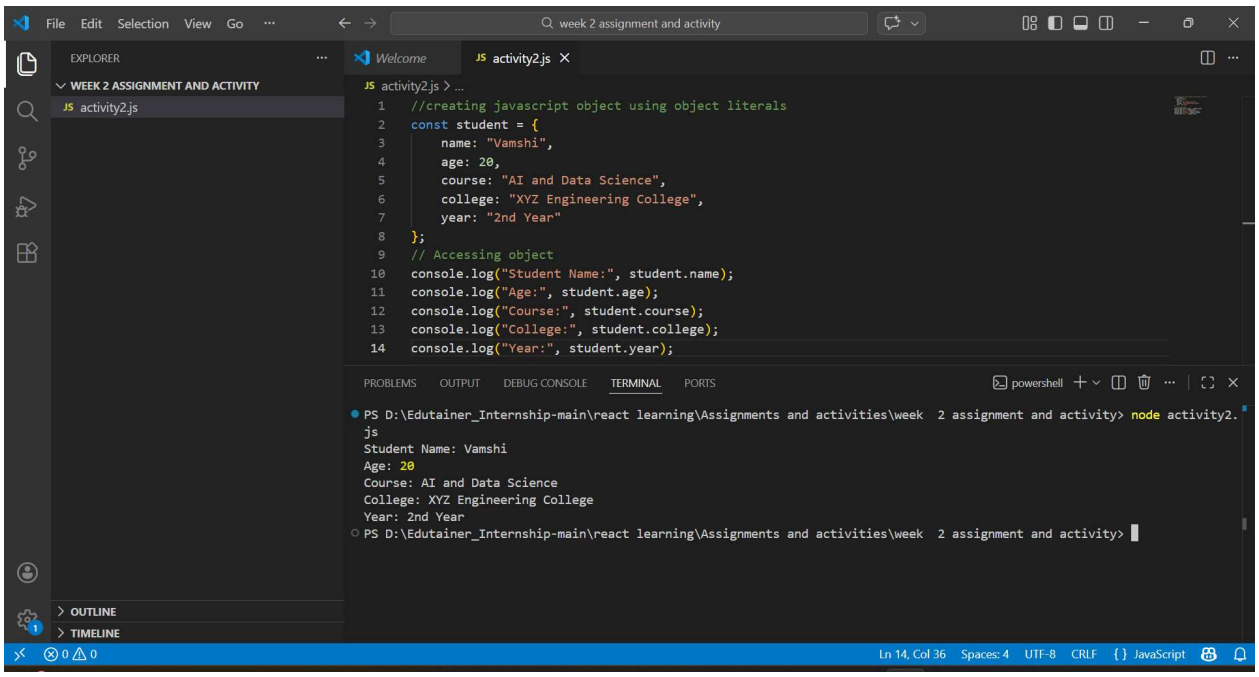
Deliverable: One object with minimum 5 properties Console output showing property access Brief explanation of object structure



Brief Explanation of object structure:-

A JavaScript object holds related data as key–value pairs. Here, we've got a student object, made with curly braces({}) that's the object literal syntax.

It has five properties:-

- name: the student's name
- age: the student's age
- course: the course they're taking
- college: which college they go to
- year: their academic year

Each bit of info has a key and a value, split by a colon. We access a property using dot notation, like student.name.

In the given example:-

```
const student = {
  name: "Vamshi",
  age: 20,
  course: "AI and Data Science",
  college: "XYZ Engineering College",
  year: "2nd Year"
};
```

- name, age, course, college, year → these are the property names (keys)
- "Vamshi", 20, "AI and Data Science", "XYZ Engineering College", "2nd Year" are the values
